Serum concentrations of total proteins, urea, creatinine, glucose, NEFA, B-OH, and enzymatic activities at 37°C of AST, ALT, AP and LDH were determined in Saanen and Alpine dairy goats, farmed in 15 herds, during lactation period (average production from 600 to 1,000 litres of milk). The data were analysed by multivariate analysis and the results showed relationship with some characteristics of milk and with physiological status of lactation.
